

# BLOOD TESTING BEFORE ANESTHESIA

Burlington Veterinary center recommends that all pets over the age of 1 have routine blood testing annually.

All patients undergoing anesthesia must have a blood chemistry and complete blood count within the 30-60 days prior to anesthesia.

Your pets blood test results will be reviewed by our veterinarian, then forwarded to you via email for your medical records.

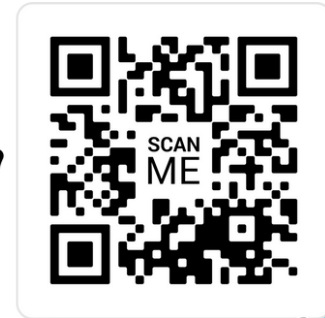

Why should my pet have its teeth cleaned?

Over 70% of all dogs and cats over five years of age suffer from periodontal disease, which means that they have loss of the supporting structures of the teeth. In most cases, this process is uncomfortable and it will eventually lead to problems such as loose teeth, bacteria in the blood stream, and damage to the kidneys, heart and liver. The majority of dogs and cats seen at this practice over the age of 5 years have one or more painful teeth in their mouth.
